

Marking Steel Reamers

Before

After

The shanks of reamers of various sizes and finishes are marked with the company name and location, as well as the reamer's part number and size. Up to three lines of information are marked with the Model T1 Programmable Stamper from Pannier.

The client had not been achieving optimal marks from the marking system (before). After reviewing the customer's parts and marking parameters, Pannier's technical support service team was able to improve the mark by changing the Model T1's settings for optimal mark quality (after). The improvements were made very quickly and provide a more professional look for immediate brand recognition and easy re-ordering information for their clients.
