

Aluminum plate in various sizes and thicknesses is marked after the surface finishing process according to international standards. Up to ten lines of information are printed, each line consisting of the manufacturer's name, plate type, and batch number.

The ten printheads are controlled by five controllers, all of which are connected to one input terminal for easy operation. To adjust the printing distance for different plate thicknesses, the printheads are installed vertically on an adjustable arm for raising and lowering. To servicing, the arm turns 90 degrees to take the printheads off-line.
