

This manufacturer needed to mark bend lines, welding and cutting marks, and job order information on steel ship construction profiles made from stainless steel and primer-coated steel. The bend lines are printed in such a way that after the profiles are bent, they appear to be straight lines.

The printhead is integrated into the steel processing machine and mounted onto a mobile platform. The platform is able to move the printhead out 60 feet while the machine prints at a speed of 300 feet per minute.
